

last week, contractor crews began planting two wetlands at Fountain City Lake – one of the last steps in the City's ongoing commitment to improve the lake's water quality.

Once the plantings are completed, the spring-fed lake will refill and saturate the new beds. The fast-growing plants – including cardinal flower, blue flag iris, button bush, soft rush and wintergreen – should fill out the new wetlands beds by this summer.

For years, thick algae has overwhelmed the lake. The City's aim has been to repair the lake's infrastructure so that the ecosystem can regain its long-term balance.

"Restoring Fountain City Lake to better health and beauty has required man-

aging and encouraging algae growth. The wetlands do that two ways:

1. There's now better water circulation in the lake, because the most shallow, stagnant areas – conducive to the formation of thick algae – have been converted into the wetlands wildlife habitat, and.

2. The wetlands plants absorb nutrients that otherwise would promote the growth of algae.

"These wetlands plantings were selected because they'll do well and require little maintenance," McGinley said. "They'll grow to between 2 and 4 feet tall. These will be controlled wetlands – not jungle, but not manicured."

Late last fall, the wetlands contractor, Ronald Frank, Construction Co.,
